

Sapphire Capability and Transparency Manual

What is tested, what is optional, and what remains outside the current implementation.

This manual describes the current local implementation. Feature names are not evidence of production scale, hardware availability, or successful external actions.

Tested

The repository tests cover language execution, file and process helpers, parallel blocks, agent plans and tools, failures, persistence, memory retrieval, sandbox boundaries, CPU/ML behavior, and CUDA reporting.

Optional

NumPy, PyTorch, psutil, requests, audio packages, AI services, NVIDIA drivers, and CUDA hardware are not bundled assumptions for every installation.

Distributed

The distributed package creates planning and code-generation artifacts. It does not prove that a cluster launched, trained, recovered, or achieved any throughput figure.

Roadmap

Native compilation, production isolation, event-driven syntax, DAG scheduling, durable neural memory, verified multi-node training, and wider security validation remain future work.

Version 1.0.5. Reproduce local measurements with `benchmarks/benchmark_runtime.py`. Values depend on the machine and environment.
